BUILDING A HOME DISTILLATION APPARATUS Foreword The pages that follow contain a step-by-step guide to building a relatively sophisticated distillation apparatus from commonly available materials, using simple tools, and at a cost of

Building a World Class Home Distillation Apparatus

Distillation is the process of separating the components or substances from a liquid mixture by using selective boiling and condensation. Distillation may result in essentially complete separation (nearly pure components), or it may be a partial separation that increases the concentration of selected components in the mixture.

Distillation - Wikipedia

Continuous distillation, a form of distillation, is an ongoing separation in which a mixture is continuously (without interruption) fed into the process and separated fractions are removed continuously as output streams. Distillation is the separation or partial separation of a liquid feed mixture into components or fractions by selective boiling (or evaporation) and condensation.

Pressure Drop Measurements on Distillation Columns

La distillation est un procédé de séparation de mélange de substances liquides dont les températures d'ébullition sont différentes. Elle permet de séparer les constituants d'un mélange homogène. Sous l'effet de la chaleur ou d'une faible pression (loi des gaz parfaits), les substances se vaporisent successivement, et la vapeur obtenue est liquéfiée pour donner le distillat.

Highlights PLS applied to distillation curves enables the prediction of octane numbers. For MON and RON, the fractions lower than 60% v/v were the most important variables. The paraffins and ethanol content has the highest influence on MON. The paraffins content has the highest influence on MON. The method produced highly accurate results and is suitable for routine analysis.
