Nanophotonics or nano-optics is the study of the behavior of light on the nanometer scale, and of the interaction of nanometer-scale objects with light. It is a branch of optics, optical engineering, electrical engineering, and nanotechnology. It often (but not exclusively) involves metallic components, which can transport and focus light via surface plasmon polaritons.

This book is designed to give a background on the origins and development of Wigner functions, as well as its mathematical underpinnings. Along the way the authors emphasise the connections, and differences, from the more popular non-equilibrium Green's function approaches.

Optical communication, also known as optical telecommunication, is communication at a distance using light to carry information. It can be performed visually or by using electronic devices. The earliest basic forms of optical communication date back several millennia, while the earliest electrical device created to do so was the photophone, invented in 1880.

Time and time again, "multidisciplinary" research is touted as essential to innovation. That is why, from April 22-26, 2019, researchers working in seemingly unrelated fields will gather in Phoenix, Arizona, to promote, share and discuss issues and developments across disciplines.. The 2019 MRS Spring Meeting & Exhibit is the key forum to present research to an interdisciplinary and ...

1. Introduction. Sunlight is the most abundant energy source available on earth, and therefore designing systems that can effectively gather, transfer, or store solar energy has been a great enduring interest for

researchers.
