Amylose is a polysaccharide made of  $\alpha$ -D-glucose units, bonded to each other through  $(1\rightarrow4)$  glycosidic bonds. It is one of the two components of starch, making up approximately 20-30%. Amylose is less soluble in water than the other component amylopectin. Because of its tightly packed helical structure, amylose is more resistant to digestion than other starch molecules and is therefore an ...

It is a common belief that starch, or any type of carbohydrate " particularly high-glycemic starches like potatoes, raises insulin. In the low-carb circles you see the idea floating around that carbohydrate ingestion raises glucose, which in turn raises insulin.

A few years back, I briefly covered a throwaway Yahoo! article about how "carbs will make you lose weight" because so many readers had emailed about it. It turned out that the "carbs" in the article were resistant starch, a type of carbohydrate that our digestive enzymes cannot break down.

Green bananas are a great way to experience resistive starch. don't worry about carbs because they don't go through the insulin process. I take 2 hard green and 2 yellow throw in blender with coco water with no added sugar and a teaspoon of ceylon cinnamon or real cinnamon which i get in sticks and grind fresh . don't use cassia cinaamon as is very bad for your liver. i also throw in a love of ...

Wheat gluten is a food made from gluten, the main protein of wheat. It is made by washing wheat flour dough with water until all the starch granules have been removed, leaving the sticky insoluble gluten as an elastic mass which is then cooked before being eaten.. Wheat gluten is an alternative to soybean-based foods such as tofu, which are sometimes used as meat substitutes.

A key message from the statistical models is that steric stabilization is most effectively achieved through the adsorption of copolymers. As illustrated schematically in Fig. 1(a), an adsorbing copolymer molecule combines two key features: anchoring groups that stick directly to the surface, and chain regions that extend away from the surface. The hydrophobic anchoring groups have a strong ...

Short-chain fatty acids (SCFAs) are produced by various human gut microbes. SCFAs act as an energy source to the colonic epithelium and are also sensed by host signaling pathways that modulate appetite and inflammation. Deficiency of gut SCFAs is associated with type 2 diabetes. Zhao et al. found that adopting a high-fiber diet promoted the growth of SCFA-producing organisms in diabetic humans.
