Chalk aquifer beneath London. This is the twenty-seventh such report (previously called "Groundwater Levels in the Chalk-Basal Sands Aquifer of the London Basin"™).

Management of the London Basin Chalk Aquifer

Aquifer properties data from 2100 pumping tests carried out in the Chalk aquifer have been collated as part of a joint British Geological Survey / Environment Agency project. The dataset is highly biased: most pumping tests have been undertaken in valley areas where the yield of the Chalk is highest.

Aquifer properties of the Chalk of England - CORE

The Chalk is the major aquifer in the UK accounting for 70% of groundwater used and 33% of the total water used in England and Wales (UK Groundwater Forum, 2003).

The permeability and storage of an unconfined Chalk aquifer

The aquifer unit penetrated by the borehole is the Upper Cretaceous Seaford Chalk, which is the main regional aquifer. The Chalk is a dual porosity aquifer, with matrix porosity in the range 35-47 ...

The Chalk Aquifer. The Chalk aquifer can be conceptualised as a dual-porosity system, with flow and transport occurring primarily in a pervasive high-transmissivity fracture network, and the bulk of groundwater being stored in the low-transmissivity porous matrix:

The ether oxygenates MTBE and TAME have been used in petroleum fuel formulations in the UK since the mid-1980s and have led to contamination of major aquifers, including the Chalk aquifer of southern England.

UK Chalk Aquifer - Introduction - solinst.com

The Chalk is a fractured rock having very fine-grained matrix. The nature of its matrix makes much of the water held within the chalk pores not able to be drained by gravity. Aquifer properties of the Chalk are controlled by fractures and larger pores (Bloomfield, 1997).

Influence of Effluent Discharge on Water Quality and Level

The Chalk aquifer is the major aquifer of the London Basin. The Chalk is confined in the basin by the overlying Tertiary formations, which means recharge largely occurs in the Chalk outcrops of the

The aquifers of the UK UK Groundwater Forum Photograph taken with an electron microscope of a Permian sandstone showing the pore spaces between the grains. The porosity is about 30%. An outcrop of the Chalk showing the inter-connected network of fractures that gives the aquifer its high permeability.

Groundwater our hidden asset - 03 Aquifers of the UK

The Chalk is the most important water supply aquifer in many parts of northern Europe (Downing et al.2005). Groundwater quality is widely monitored and regulated, and
