The Flame Test The flame test is a qualitative test used in chemistry to help determine the identity or possible identity of a metal or metalloid ion found in an ionic compound. If the compound is placed in the flame of a gas burner, there may be a characteristic color given off that is visible to the naked eye.

### **The Flame Test - Science Olympiad**

Flame Burns. When an individual is exposed to open fire, he or she runs the risk of suffering a flame burn. These injuries vary in severity, and victims may experience anything from minor pain and blistering to permanent scarring and disfigurement.

Guide to the identification of different polymers by burning on direct flame. Our tests and observations were conducted by taking sheeting samples.

### **Identification of Different Polymers by burning on direct**

CANDLES UNDER JARS The shading in this picture represents the carbon dioxide content of the air. The candle burns, giving off carbon dioxide, until the cloud of carbon dioxide is deep enough to reach the flame. Taller candles go out before shorter candles because they are engulfed more quickly by the descending, burgeoning cloak of CO<sub>2</sub>-rich air.
