of uncertainty, the model structure and parameterisations have drawn more attention from hydrologists (Wagener et al., 2001). Simply speaking, the uncertainty related to hydrological modelling is categorised as: that from the inability to obtain the state of the system and that due to inefficient modelling of reality.

MetEOC-1 as an intermediate level training course for uncertainty analysis with emphasis on radiometric instrument calibration and characterisation for Earth Observation. The textbook does not follow the course lectures completely, but is designed as a stand-alone "teach yourself"™ guide which is supplemented by the lectures.

Measurement uncertainty analysis is a formal process of identifying and quantifying possible errors and combining the results to obtain an estimate of the total uncertainty of a measurement [61]. An inherent part of this process is understanding the potential problems that can affect the results of any given PV performance measurement.

In this study, uncertainty of load and resistance parameters were included in analysis of rammed earth structures. The reliability index and failure probability of RE structures were evaluated using First-Order-Reliability-Method (FORM). The analysis was performed based on the different loads and resistance random variables parameters.

ston and Kleb5 performed a detailed uncertainty analysis of forebody radiative heating during Lunar-return Earth entry. Similar uncertainty sources in the computational model are considered in the present study, which include old chemical rate models, atomic line emission and absorption, photoionization cross-

begin the discussion of how uncertainty can best be represented in future data products and incorporated into Earth science analyses to fully exploit the information value of global imaging spectroscopy. This analysis is intrinsically statistical and probabilistic in nature. To date, probabilistic
